

# EXTREMELY LOW ELECTRICAL CONSUMPTION

- Combining high thermal efficiencies with low electrical consumption; Pulse boilers have the lowest net energy usage in the industry.
- During run mode, Pulse boilers use only 90 Watts of electrical power due to the unique self-aspirating design that has no power burner or blower motor.

To put it into perspective, popular coffee makers require over 15 times more power to run than Pulse boilers!

You'll get a lot more hot water out of a Pulse for far less electricity!
